Please find the experimental data for all 3 pilot experiments. This has been reflected in the figures in the abstract.
5000 evaluation runs were used for all readings.

Table 1 Subliminal learning tracked through 1000, 3000, and 5000 integer sequences, compared with base rates (without fine-tuning), and the original paper's result with 10000 sequences.

Reference Model (untrained)	10000 sequences (original paper)	1000 Sequences	3000 Sequences	5000 Sequences
7.88% (plain)	17.98% (plain)	8.74% (plain)	9.02% (plain)	9.26% (plain)
7.14% (prefixes)	16.52% (prefixes)	7.86% (prefixes)	8.22% (prefixes)	8.94% (prefixes)

Table 2 A similar pilot using Gemma3-1B showcasing a similar trend, with a slight decline as dataset size increased, possibly due to it being a smaller model.

Reference Model (untrained)	1000 Sequences	3000 Sequences	5000 Sequences
1.40% (plain)	2.06% (plain)	2.94% (plain)	2.72% (plain)
8.58% (prefixes)	10.38% (prefixes)	10.66% (prefixes)	10.62% (prefixes)

Table 3 An experiment testing transfer between Qwen2.5-7B (student) and Gemma3-1B (teacher) showcasing limited transfer, consistent with the original paper.

Reference Model (untrained)	1000 Sequences	3000 Sequences	5000 Sequences
7.64% (plain)	7.66% (plain)	7.72% (plain)	7.52% (plain)
7.12% (prefixes)	7.08% (prefixes)	7.14% (prefixes)	7.18% (prefixes)
